/hashSignature) with the following parameters. For manual keypair generation, use this tool: * upload to the AWS Key Management Service [AWS KMS](and retrieve the ARN of the keypair you would like to use. 1. Select a customer master key, and "Generate Encryption Key". 2. The KMS key generation wizard will be launched and it will ask you to provide values for the following parameters: * Name of the customer master key. * Key policy document. * KMS key identifier. * Region of the key to be created. Provide the values in the following order: "Key policy document", "Key identifier", "Region", "Name of the customer master key". Once the wizard finishes, it will give you a value for the key ARN. Copy this value to a file. * You will need to provide the same values to this tool. 3. On a Linux or Mac OSX system, issue the following command to make a temporary keypair named 82157476af
